

WebOrder 2.0

Vincent Oorsprong

New era

- › After 47 years it is time for a new example
- › Examples make it easier to get you started
- › We called the first new sample: WebOrder2
- › Let's give you a quick introduction & demo

Database

- › Now using MSSQL as database
- › Tables merged and new tables added
 - › Salesperson, Customer and Vendor
 - › Categorized by contact type
 - › While merged the tables are available via an alias table construction

Database

- › No use of codemast / codetype
 - › They do not offer a clean parent – child relationship
 - › Bad for reporting functionality
 - › Shipping – in old order entry via codemast – is now a table on its own

Database

- › Addresses table
 - › Allows multiple addresses per contact
 - › Work, home, shipping, billing
 - › Categories can be extended on demand
- › Product
 - › Kind of replacement of inventory
- › Product category
 - › Can be extended on demand

Order status

- › The flow of an order can be changed
 - › Can be used to block changes once it reaches a status

History

- › Product mutations
 - › On hand mutations over time
 - › Easy to see which order decreased or increased the amount of products available
- › Order mutations
 - › When and who changed the status of an order

Encryption

- › The password of the user that can login is stored using the libsodium techniques

Active / Inactive

- › Contacts can be active or inactive
 - › Visible clue in the customer select view
 - › Maintenance
 - › In new order customer hidden
- › Products can be active or inactive
 - › Visible clue in the product select view
 - › Maintenance
 - › In new order detail line not shown

Reports

- › All reports from the classic weborder mobile workspace
 - › Modified to the new database structure
- › New report: Number of orders per status

Amount of orders per status

Nice to have

- › Search field on the dashboard
 - › Search for orders, customers, vendors, salespersons and products
- › New tiles (vendors and sales persons)

Webservices

- › Three SOAP based function calls available
 - › GetOrder:
 - › Returns the order details for one specific order
 - › GetOrders:
 - › Returns all orders for a specific customer
 - › GetOrdersWithStatus
 - › Returns all orders for a specific customer with a certain status

When

- › The new example will be available for download soon
 - › We are working on the last couple of issues and then release a DataFlex 20.1 version
- › We are open for suggestions in what to add more to the example

Thank you!
