

Hot Features

Bram Nijenkamp

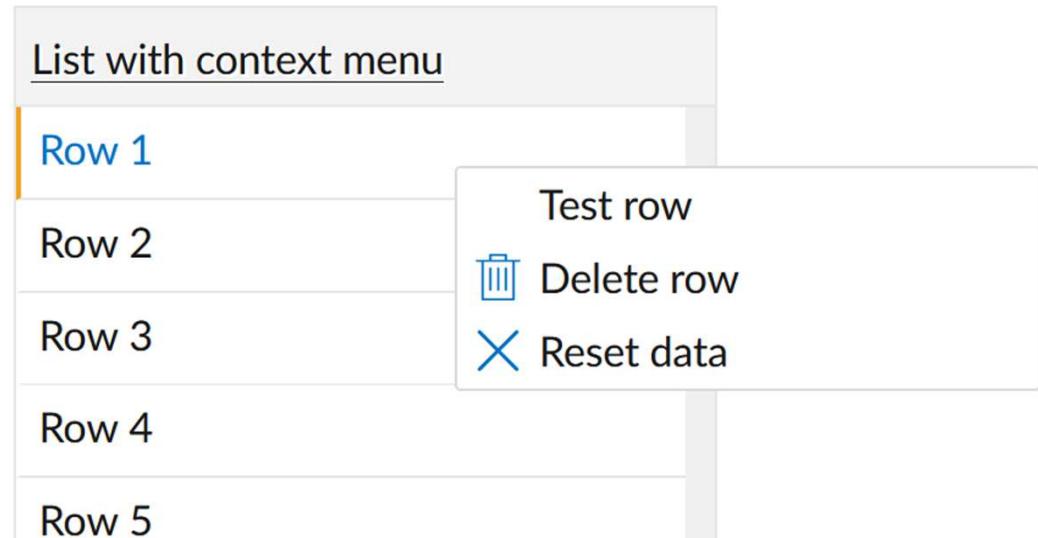

What are these “hot” features?

- › WebContextMenu
 - › HeaderMenu
- › WebMultiSelectList
 - › – Easy as it is!

WebContextMenu

- › Introduced in 20.1!
- › Provides the ability to add ‘extra’ or ‘advanced’ features.
 - › Windows to Web.
- › Menu-API compatible.
- › Extendable!

How does the thing work?

- › Scoping and focus;
 - › Scoping:
 - › phoControl
 - › psControlName
 - › Focus:
 - › peContext
 - › psContextCSSSelector

What are these Contexts then?

Scopes can provide additional context as to what was right-clicked on.

- If a non-custom peContext is set it will provide the context in **psContextValue**

Contains either a RowId (String) or Value in any format.

What Contexts are provided out of the box?

Default: C_WebUIContextCustom

- Use psContextCSSSelector to specify the focus!

WebList:

- WebUIContextListHead (23.0) (no-child-scopes)
- WebUIContextListRow
- WebUIContextListSelection (23.0)

WebTreeList:

- WebUIContextTreeviewFolder
- WebUIContextTreeviewItem

WebTagsForm:

- WebUIContextTagsFormTag

Scopes can cover more than one control

- › What if I want my ContextMenu to cover the whole view, including the CommandBar?
 - › Set psControlName to "window"
- › What if I want my ContextMenu to cover the whole webapp (across views)?
 - › Place it into the oWebApp.
- › What if I want to cover multiple controls with one menu of the same context (23.0)
 - › pbChildScopes

Let's take a look at some Contexts shall we?

How can I use them in a custom control?

There are several APIs available!

Implement a minimal
of **2** APIs and it
works!

With a total of **5**
interfaceable
functions available to
do with as you please.

How does a context do what it does?

- › How does it determine the psContextCSSSelector?

```
determineSelectorForWebUIContext : function (eContext) {  
    switch (eContext) {  
        case df.WebUIContext.WebUIContextTagsFormTag:  
            return ".WebTgf_Tag[data-dfrowid]";  
    }  
    return null;  
}
```

How does it do what it does?

- › How does it retrieve the psContextValue?

```
retrieveValueFromWebUIContext : function (eElem, eContext) {  
    switch (eContext) {  
        case df.WebUIContext.WebUIContextTagsFormTag: {  
            if (!eElem.hasAttribute('data-dfrowid'))  
                break;  
            return eElem.getAttribute('data-dfrowid')  
        }  
    }  
    return null;  
}
```

How does it do what it does?

- › How can I block certain elements that have the same CSS?

```
verifyElementForWebUIContext : function (eElem, eContext) {  
    switch (eContext) {  
        case df.WebUIContext.WebUIContextTagsFormTag: {  
            if (!eElem.classList.contains('persist')) {  
                return false;  
            }  
            break;  
        }  
        return true;  
    }  
}
```

How does it do what it does?

- › What if I want to know what menu is attaching (reverse-bind)?

```
bindHandlerForWebUIContext : function (oObj, eContext) {  
    switch (eContext) {  
        case df.WebUIContext.WebUIContextListHead:  
            this._oHeader?.registerHeaderMenu(oObj);  
        }  
        return true;  
    }  
    unbindHandlerForWebUIContext : function (oObj, eContext) {  
        switch (eContext) {  
            case df.WebUIContext.WebUIContextListHead:  
                this._oHeader?.unregisterHeaderMenu(oObj);  
            }  
            return true;  
    }
```

Any questions, before we go to the MultiSelectList?

WebMultiSelectList

- › “I just want to select these rows, why is that so hard!?”
 - › No more cWebColumnCheckbox for selections
 - › Data-Aware
 - › Drag & Drop compatible
 - › Struct tWebMultiSelectListDragData
 - › tWebRow[] data
 - › End_Struct
 - › WebUIContext compatible

Let's jump straight into the demo!

Thank you!

Are there any questions?

HOT HOT TOO HOT
